

## ABSTRACT OF THE DISCLOSURE

An operation guidance method of clinical system which enables a doctor or nurse unskilled in testing to operate the clinical system without operation error by providing operation guidance. In the system, an initial screen shows numerals 1 to 5 indicating the order of procedure of sample test and character information indicating the contents of works (1 confirmation of sample, 2 confirmation of request, 3 feeding samples, 4 confirmation of result and 5 finish) as contents displayed in an operation menu. When an operator selects a "start" button, display images showing as guidance on the respective works are sequentially displayed. Further, a display image as guidance on arbitrary one of the works may be displayed by selection of one of the works in the operation menu.
